

Week 1: Research & Project Planning

Day	ACTIVITIES	NEW SKILL LEARNED
Day 1	Researching E-commerce Ideas: Looked at different online tech stores to see what features they have; decided on building a store for high-end tech products.	Project Planning: Learned how to pick the most important features to build first so the project doesn't get too big.
Day 2	Choosing the Technology: Read about Next.js for the frontend and Laravel for the backend; learned why they are good for building fast websites.	Web Technology: Gained an understanding of how the "frontend" (what users see) talks to the "backend" (where data is stored).
Day 3	Listing Requirements: Wrote down a list of what a customer can do (buy products) and what an admin can do (manage stock).	Requirement Gathering: Learned how to turn a simple idea into a list of technical tasks.
Day 4	Drawing User Flows: Sketched a simple map of how a user goes from the home page to the checkout page.	Logic Mapping: Developed the skill of visualizing how a user moves through a website before starting to code.

Week 2: Diagrams & Database Design

Day	ACTIVITIES	NEW SKILL LEARNED
Day 1	Making a Swimlane Diagram: Drew a chart to show how the User, the Website, and the Admin interact during an order.	Process Mapping: Learned how to show who is responsible for what action in a complex system.
Day 2	Designing the Class Diagram: Planned the main parts of the code like "User," "Product," and "Order" and how they connect.	System Design: Mastered the skill of organizing code into logical groups before typing any actual code.
Day 3	Drawing the Database Map (ERD): Designed the tables for the database (Users, Products, Categories) and how they link together.	Database Design: Learned how to link different tables using "Keys" so the data stays organized.
Day 4	Database Rules: Listed exactly what kind of information goes into each table (like numbers for prices and text for names).	Data Organization: Learned how to avoid double-entering data by keeping the tables clean and simple.

Week 3: Frontend Setup & Simple Parts

Day	ACTIVITIES	NEW SKILL LEARNED
Day 1	Starting the Project: Installed the coding tools and set up the Next.js folder; tried out some basic styling with Tailwind CSS .	Environment Setup: Learned how to prepare a professional workspace for building a modern website.
Day 2	Learning TypeScript: Practiced writing code that checks for errors automatically; set up simple rules for "User" and "Product" data.	Type Safety: Gained an understanding of how to catch coding mistakes early by using stricter code rules.
Day 3	Building Basic Buttons: Created the first reusable parts of the site like buttons and text boxes that can be used on every page.	Component Reusability: Learned how to write code once and use it many times, which saves a lot of time.
Day 4	Adding Icons: Added a library called Lucide to put small icons (like a shopping cart or search magnifying glass) on the site.	UI Enhancement: Learned how small visual details like icons help users understand the website better.

Week 4: Page Layouts & Navigation

Day	ACTIVITIES	NEW SKILL LEARNED
Day 1	Defining Data Shapes: Wrote down the exact structure for a "Tech Product" (Name, Price, Brand, Specs) so the code knows what to expect.	Data Interfacing: Mastered the skill of planning how data should look before actually showing it on the screen.
Day 2	Building the Navbar: Created the top navigation bar and the footer that stay the same on every page of the site.	Layout Persistence: Learned how to keep the main menu visible while the user clicks through different pages.
Day 3	Mobile Menu Design: Made sure the navigation bar works on small phone screens by creating a "hamburger" menu.	Responsive Design: Gained experience in making a website look good on both computers and mobile phones.
Day 4	Setting Page Titles: Added code to automatically show the correct title in the browser tab (like "Lumina - Home").	SEO Basics: Learned how to help search engines understand what each page on the website is about.

Week 5: Showing Products with Fake Data

Day	ACTIVITIES	NEW SKILL LEARNED
Day 1	Creating Fake Data: Made a file with 10-12 fake tech products to test how the website looks without a real backend.	Mocking Data: Learned how to simulate a database so I can keep building the frontend while the backend isn't ready.
Day 2	Making Product Cards: Built the design for a single product (showing its image, name, and price) with a nice "hover" effect.	Visual Design: Mastered the process of making a single item look professional and interactive for the user.
Day 3	Displaying the Product Grid: Wrote code to loop through the fake data and show all the product cards in a nice grid.	Dynamic Lists: Gained experience in showing a list of items automatically instead of typing them out one by one.
Day 4	Product Quick View: Made a "Quick View" popup so users can see more details about a product without leaving the page.	State Management: Learned how to show and hide parts of a page based on what the user clicks.

Week 6: Search bar & Shopping Cart

Day	ACTIVITIES	NEW SKILL LEARNED
Day 1	Making the Search Bar work: Added code so users can type a name and see only the products that match.	Data Filtering: Learned how to write code that searches through a list and hides things that don't match.
Day 2	Category Filters: Added a sidebar so users can click "Laptops" or "Phones" to see only those specific items.	User Experience: Gained skills in helping users find exactly what they want quickly on a large website.
Day 3	Building the Shopping Cart: Wrote the logic to let users add items to a cart and see the total price update automatically.	Business Logic: Mastered the process of doing real-time math (adding up prices) inside a website.
Day 4	Saving the Cart: Made the cart "remember" what was in it even if the user refreshes the page or closes the browser.	Browser Storage: Learned how to save small amounts of data directly on the user's computer for a better experience.

Week 7: Fake Login & Admin View

Day	ACTIVITIES	NEW SKILL LEARNED
Day 1	Setting up Fake Auth: Created a simple way to "simulate" being logged in so I can test protected pages.	Global State: Learned how to make the website remember if someone is "Logged In" across all the different pages.
Day 2	Login & Sign-up Forms: Built the design for the login and registration pages and added simple error messages for empty fields.	Form Design: Gained skills in building and checking forms to make sure users enter the right information.
Day 3	Admin vs. Customer View: Added code to show an "Admin Dashboard" link only if the logged-in user is an administrator.	Conditional UI: Mastered the technique of showing different buttons or pages to different types of users.
Day 4	Protecting Pages: Wrote code that kicks a user back to the home page if they try to go to the Admin area without logging in.	Route Protection: Learned the basics of website security by blocking access to private pages.

Week 8: Starting the Backend (Laravel)

Day	ACTIVITIES	NEW SKILL LEARNED
Day 1	Installing Laravel: Set up the backend server on my computer and made sure it could send a "Success" message to the browser.	Backend Setup: Learned how to install and run a professional server-side framework.
Day 2	Learning the Folders: Explored how Laravel is organized; learned where the logic goes and where the database settings are.	Framework Structure: Gained an understanding of how large backend projects stay organized so they don't get messy.
Day 3	Simple API Routes: Created the first "Path" for the website (like <code>/api/hello</code>) and learned how to send data back as a JSON list.	API Basics: Learned how the server sends structured data that the frontend can understand and use.
Day 4	Using Controllers: Moved the server logic into separate files called	Code Organization: Mastered the skill of keeping different parts of the code

	“Controllers” to keep the project clean.	separate so they are easier to fix later.
--	--	---

Week 9: Connecting the Database

Day	ACTIVITIES	NEW SKILL LEARNED
Day 1	Connecting PostgreSQL: Linked the Laravel backend to the database I designed in Week 2.	Server Configuration: Learned how to securely connect a web server to a database using secret settings.
Day 2	Building Database Tables: Used Laravel "Migrations" to automatically build the Products and Categories tables in the database.	Database Automation: Learned how to use code to build and change database tables instead of doing it manually.
Day 3	Creating Data Models: Wrote the code that lets the backend "talk" to the database tables easily using simple commands.	Data Mapping: Gained experience in treating database rows like objects in my code, which makes it much easier to use.
Day 4	Adding Sample Data: Put some real sample products into the database to test if the connection was working.	Database Testing: Learned how to fill a database with test data to make sure everything is working correctly.

Week 10: Building the Real API

Day	ACTIVITIES	NEW SKILL LEARNED
Day 1	Making the Product List API: Wrote the code to send the list of products from the database to the website.	Data Delivery: Learned how to send a long list of products in small "chunks" (pagination) so the site stays fast.
Day 2	Getting Single Product Details: Created a path to get all the details for just one specific product when a user clicks it.	Specific Data Fetching: Mastered the skill of asking the database for one specific item based on its unique ID number.
Day 3	Admin Edit Tools: Started building the paths that will let an Admin add or delete products from the database.	CRUD Operations: Gained experience in the four main database actions: Create, Read, Update, and Delete.
Day 4	Testing with Postman: Used a tool called Postman to test all the server paths and make sure the data was correct.	API Testing: Learned how to use professional tools to check if a server is working without using the website UI.

Week 11: Final Connection & Error Fixing

Day	ACTIVITIES	NEW SKILL LEARNED
Day 1	Connecting Frontend to Backend: Replaced the fake data from Week 5 with real data coming from my Laravel server.	Full-Stack Integration: Mastered the process of making the frontend and backend work together as one single system.
Day 2	Handling Crashes: Added "Safety Nets" to the code so the whole site doesn't crash if the server has an error.	Error Resilience: Learned how to show "Server is busy" messages instead of just a blank white screen when things go wrong.
Day 3	Checking User Input: Added code to double-check that users enter valid data (like real emails) before the server accepts it.	Server Validation: Gained skills in protecting the database from bad or malicious data sent by users.
Day 4	Custom Error Pages: Designed nice looking "Page Not Found" and "Server Error" pages to keep the site looking professional.	User Experience: Learned that how you handle errors is just as important as how you handle success.

Week 12: Final Testing & Manuals

Day	ACTIVITIES	NEW SKILL LEARNED
Day 1	Final Testing on Devices: Checked the website on different browsers (Chrome, Firefox) and on my phone to find any bugs.	Browser Compatibility: Learned how to fix small layout issues that only appear on certain types of screens or browsers.
Day 2	End-to-End Test: Tested the whole process from start to finish—browsing, adding to cart, and "checking out."	Quality Assurance: Mastered the process of checking the entire "User Journey" to make sure there are no broken links.
Day 3	Writing the README: Wrote a simple manual explaining how to install and run the project for another developer.	Technical Documentation: Learned how to explain technical steps in simple words so anyone can follow them.
Day 4	Final Cleanup: Cleaned up the code, removed any unused files, and prepared the final lookback for	Project Delivery: Developed the discipline to "polish" a project before finally

4

prepared the final logbook for
submission.

handing it over.
